

FEATURES OF EDUCATION OF STUDENTS' COMMUNICATION SKILLS

Zhakupova Galina Spataevna,
Senior Lecturer at the Department of Pedagogy,
Osh State University. Kyrgyzstan

Annotation

The article shows the role and place of modern information technology in the education of schoolchildren, emphasizing that education is aimed at the formation of a person as an individual, his relationship to the world, society, and people. Therefore, it is important to use electronic educational resources in the educational process.

Keywords: Education, information and innovative technologies, professional teachers, electronic educational resources, Internet, educational tools.

Introduction

At the present educational stage in the Republic, due to the changed living conditions of modern man, the introduction of new information and innovative technologies into all spheres of human activity, society makes many demands on the graduate model.

Today it has become obvious that the orientation of the activities of educational institutions only on the formation of knowledge, skills and abilities leads to public dissatisfaction with the results of the education system.

Society expects deeper pedagogical results from teachers, determined by the increasing level of informatization, education and development of graduates, in particular:

- Currently, society needs teachers - professionals who are able to independently and rationally solve problems;
- the graduate must be able to identify the information he needs from the abundance of information and apply it in a changed situation;
- school graduates must be able to adapt to life in society, in any social environment.

Therefore, the tasks of education and upbringing are changing.

Analysis of literature on the topic

As modern research shows, of all the technical means of teaching, the computer best suits the structure of the educational process. It most fully satisfies didactic requirements and allows you to manage the learning process, maximally adapt it to the individual characteristics of the student. The computer is a tool, the spread of which is associated with the restructuring of the main types of human activity, changes in the system of social conditions, requirements for the mental and mental characteristics of a person. The use of a computer in the learning process essentially represents a formative experiment aimed at studying and developing new personality traits. Important for the modern period of computerization of education is the awareness of the fact that the use of computer technologies will make the learning process more effective if they are used as a tool of cognition rather than knowledge transfer. Our goal was to examine the use of computers in the classroom to develop communication skills.

In the studies of many teachers at the end of the last century, the question of the relevance of the chosen topic has already been raised. Domestic teacher Abdukadyrov A.A. in his study "Theory and practice of intensifying the training of teachers of physical and mathematical disciplines. Aspect of the use of computer tools in the educational process."¹ reveals the need to use ICT in the educational process.

Teachers Clarin M.V. in the manual "Pedagogical technology in the educational process", Kleiman G.M. in the manual "Schools of the Future: Computers in the Learning Process."², in the work of Faberman B.L. "Advanced pedagogical technologies."³.

Let us recall the classification of that we adopted as a basis N.A. Loshkareva, who identified four groups of general educational skills:

- educational and organizational;
- educational and intellectual;
- educational and communication;
- educational and informational.⁴

Research Methodology

Education, in contrast to training, where the focus is on the formation of a person's cognitive processes, his abilities, his acquisition of knowledge, skills and abilities, is aimed at the formation of a person as an individual, his relationship to the world, society, and people. Education is not a separate process, but a side of learning that has many similarities and differences.

The main task of education at school is the formation and development of future specialists as individuals who have the necessary qualities for life in society. The goals of education change with changes in the system of social structure and social relations, and the methods and technologies of education change along with this. Each time they are given in the form of requirements that new trends in the development of society impose on a person's personality. During more or less stable periods of social development, the goals of education become stable. During significant socio-economic changes, they become uncertain.

Educational means are different, and one of the most effective at the present stage of education is information technology, or computer technology. The importance of electronic educational resources located today on educational portals on the Internet cannot be underestimated. The relevance of these resources in complementing the existing electronic literature in libraries and the ability to quickly search and access the necessary material.

Discussion and results

Computer education and training include several concepts:

- development of communication skills of students;
- managing students' activities using a computer;

- use of the Internet as a huge additional information resource for training and education;
- maintaining interest in learning and education, as a means for self-education.

The Internet can be used as a means of communication, as a means of education, as a means of entertainment, as a means of education, and as a means of obtaining information. The use of information technology in the classroom involves the following important aspects:

- intensive use of computers as a tool for the daily educational work of students and teachers;
- changing the sources of training content;
- development of independent search and research methods

the work of students during the implementation of educational telecommunications projects;

- teaching students methods of collective problem solving;
- preparing teachers to work with new content, new methods and organizational forms of training and education.⁵

The Internet provides teachers with numerous opportunities to obtain information in various fields, to keep abreast of modern life, to be “way ahead” of their students.

During educational information hours and spiritual hours, it is necessary to use such methods of working on the Internet as learning programs, introductory programs, viewing programs, and search programs. As important as the issue of the country's development is the issue of education, the President of Kyrgyzstan Sadyr Japarov said at the presentation of new educational institutions in Bishkek, the press service of the Kyrgyz leader reports.

According to him, for the first time in Bishkek, 15 educational institutions were built and put into operation in five months.

These schools are clear evidence that the state has begun to pay serious attention to the education sector, he said.

“No matter how important the task of developing our country is, the tasks of education, which are at the forefront of efforts to develop the country, are even more important and necessary! Currently, the whole world, including Kyrgyzstan, is facing modern challenges and threats. As scientists around the world say and warn, all of them can only be overcome with an educated society. Only an educated society is the basis for peace and stability, economic development and conservation of natural diversity,” he said.

Kyrgyzstan is making active efforts, paying special attention to improving the quality of education and ensuring sufficient funding for this sector, he said.

“Today we are focusing on the digitalization of all structures, including the education sector, and we are doing a lot of work to create a digital system,” he said⁶.

Conclusions and offers

Thus, you can organize presentations and online conferences with peers from other schools during extracurricular elective classes and math clubs. This can include teaching Russian terms in foreign languages, as well as educational online games, tests and questionnaires, fiction in electronic publications, popular and classical music.

⁶ <https://bilim.akipress.org/ru/news:1803055>

Thus, computer communication allows access to practically unlimited amounts of information stored in centralized data banks, being a powerful tool in the hands of a teacher, both in the educational and educational process at a university.

This makes it possible to rely on the entire stock of knowledge available to a resident of the "information society" when organizing educational activities.
